The Real Cost of Benchmarking

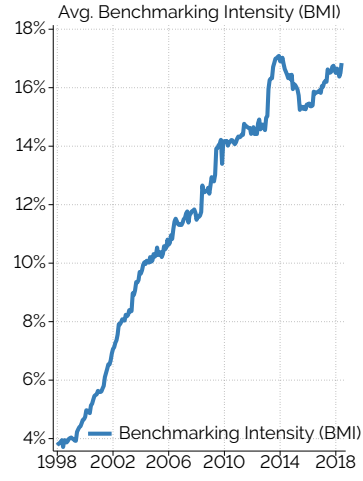

Christian Kontz
Stanford GSB

Sebastian Hanson
Stanford GSB

January 2026

Does benchmark-linked ownership affect the real economy?

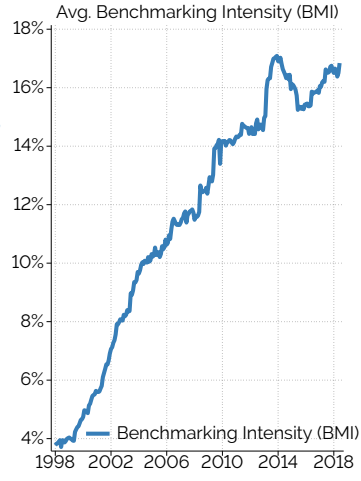

- Large increase in **benchmark-linked** ownership since 1990s
  - Passive index funds and ETFs
  - Quasi-indexing by active funds

Does benchmark-linked ownership affect the real economy?

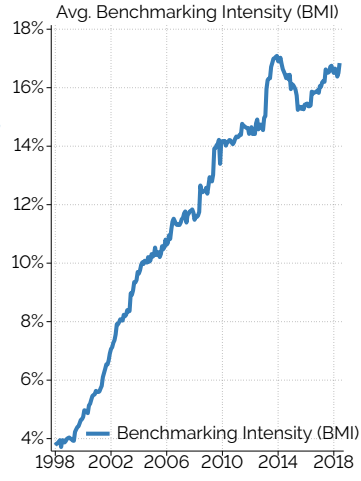

- Large increase in **benchmark-linked** ownership since 1990s
  - Passive index funds and ETFs
  - Quasi-indexing by active funds

- **Inelastic demand** of benchmarked funds affects **asset prices**
  - Price effects at index inclusion
  - Excess comovement of index stocks

Does benchmark-linked ownership affect the real economy?

- Large increase in **benchmark-linked** ownership since 1990s
  - Passive index funds and ETFs
  - Quasi-indexing by active funds
- **Inelastic demand** of benchmarked funds affects **asset prices**
  - Price effects at index inclusion
  - Excess comovement of index stocks
- Firm managers use asset prices to guide **investment policy**
  - q-Theory (Tobin, 1969; Hayashi, 1982)
  - CAPM (Sharpe, 1964; Myers, 1967)

Plan for today's talk

1. MBA Textbook Model and **Data**
2. Three Novel Stylized Facts About the **Cross-section of Benchmark Stocks**
3. Effects of Benchmark-linked Ownership on CAPM β and **Perceived Cost of Equity**
4. Effects of Benchmark-linked Ownership on **Firm Investment**
5. Effects of Benchmark-linked Ownership on **Aggregate Investment**

MBA Textbook Model and Data

MBA textbook: CAPM β determines firm value and investment

- Manager maximizes firm value using **CAPM-implied discount rate:** $R = R^f + \beta \times 6\%$
- Manager sets **investment policy** using NPV rule: $\mathbb{E}\left[\frac{\text{Net Cashflow}}{R^f+\beta\times 6\%}\right] > 0$

MBA textbook: CAPM β determines firm value and investment

- Manager maximizes firm value using **CAPM-implied discount rate:** $R = R^f + \beta \times 6\%$
- Manager sets **investment policy** using NPV rule: $\mathbb{E}\left[\frac{\text{Net Cashflow}}{R^f + \beta \times 6\%}\right] > 0$
- Inelastic demand of **benchmark-linked ownership** affects discount rate

$$\widetilde{R} = R^f + [\beta + \Delta_\beta(BMI)] \times 6\% - \Delta_P(BMI)$$

- Benchmarking has **two competing effects** that increase in benchmarking intensity
  1. Price effect $\Delta_P(BMI) \rightarrow$ lowers discount rate $\rightarrow$ more investment
  2. Comovement $\Delta_\beta(BMI) \rightarrow$ increases discount rate $\rightarrow$ less investment

MBA textbook: CAPM β determines firm value and investment

- Manager maximizes firm value using **CAPM-implied discount rate:** $R = R^f + \beta \times 6\%$
- Manager sets **investment policy** using NPV rule: $\mathbb{E}\left[\frac{\text{Net Cashflow}}{R^f+\beta\times 6\%}\right] > 0$

Three Novel Stylized Facts About Benchmark Stocks

Fact 1: Benchmarking intensity positively correlates with CAPM β estimates

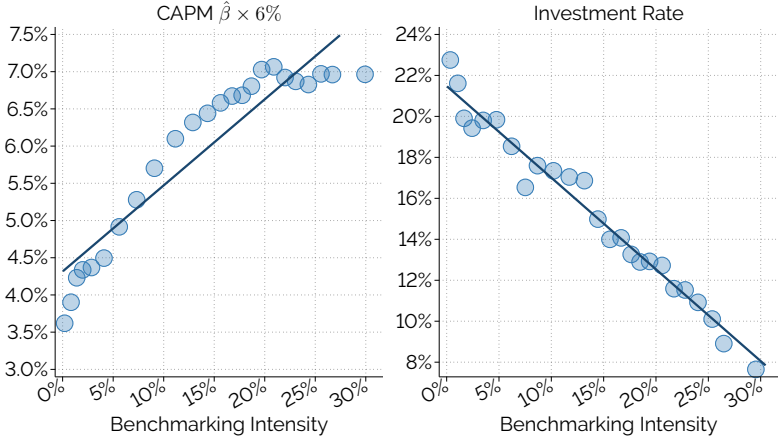

$$\text{CAPM } \hat{\beta} \times 6\% = \textbf{BMI} + \text{Year} \times \text{Size FE} + \varepsilon$$

▸ Fact 1 vs ranks ▸ Other β freq. (reg) ▸ Variation within cell

Fact 2: Benchmarking intensity negatively correlates with firm investment

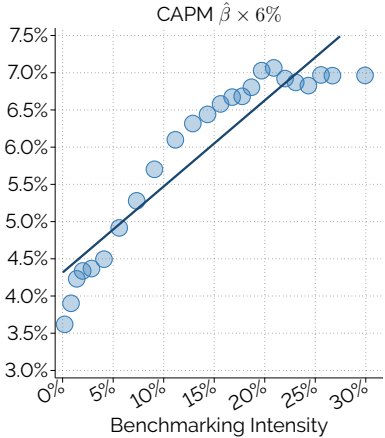

$$\text{Investment Rate} = \textbf{BMI} + \text{Year} \times \text{Size FE} + \varepsilon$$

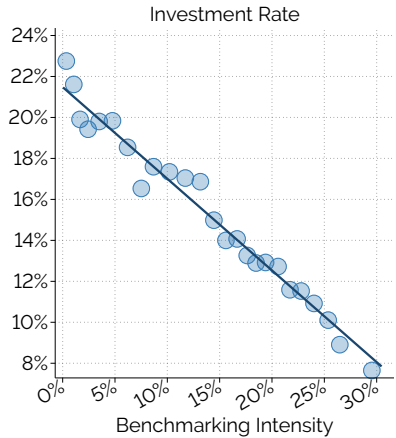

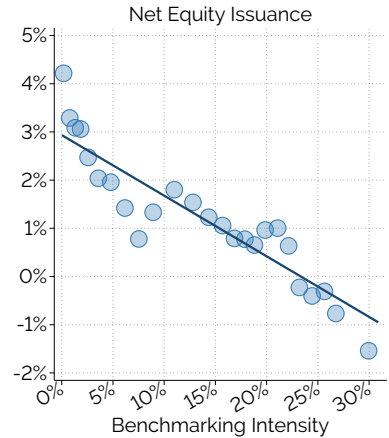

▸ Fact 1 vs ranks ▸ Other β freq. (reg) ▸ Variation within cell ▸ Fact 2 vs ranks ▸ Other inv. rate defs.

Fact 3: Benchmarking intensity negatively correlates with equity issuance

$$\text{Net Equity Issuance} = \textbf{BMI} + \text{Year} \times \text{Size FE} + \varepsilon$$

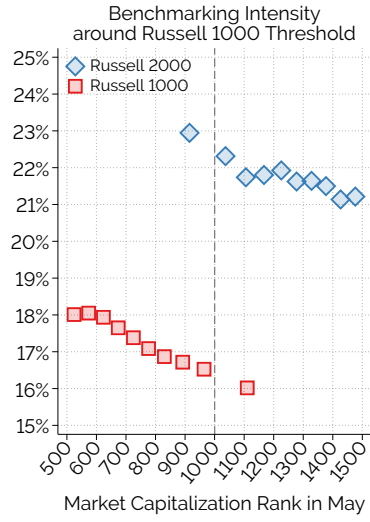

Effects of Benchmark-linked Ownership on CAPM $\hat{\beta}s$

Identification strategy uses exog. variation in BMI from Russell reconstitution

- Around **27% of AUM** in U.S. domestic equity funds are **benchmarked to Russell** indices (Pavlova & Sikorskaya, 2023)

- Each year Russell ranks all common stocks by mkt cap
  - Top 1000 → Russell 1000
  - Next 2000 → Russell 2000

NB: **Russell 2000** is a popular **benchmark** for **passive index funds** ▸ IOR

Identification strategy uses exog. variation in BMI from Russell reconstitution

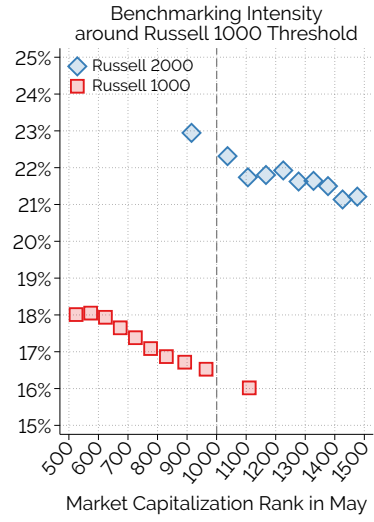

- Around **27% of AUM** in U.S. domestic equity funds are **benchmarked to Russell** indices (Pavlova & Sikorskaya, 2023)

- Each year Russell ranks all common stocks by mkt cap
  - Top 1000 → Russell 1000
  - Next 2000 → Russell 2000

NB: **Russell 2000** is a popular **benchmark** for **passive index funds** ▸ IOR

- We account for particularities of Russell identification
  - Ranking variable (proxy of Ben-David et al., 2019)
  - Banding variables post-2007 (Appel et al., 2019)
  - Liquidity, bid-ask spreads (Pavlova & Sikorskaya, 2023)
  - Window of +/- 300 ranks around threshold

- Identification assumption: firms do not self-select into index
  - No evidence that firms try to manipulate (Limburg, 2024)

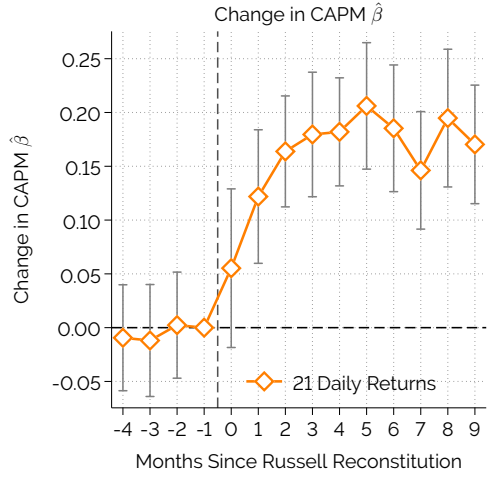

▸ Accuracy of rank proxy ▸ Relevance condition of ΔBMI ▸ Replication of Pavlova & Sikorskaya (2023) ▸ Exclusion restriction tests

Exogenous increase in BMI leads to increase in CAPM $\hat{\beta}$

$$\text{CAPM } \hat{\beta}^{21d} = \sum_{k=-4}^{9} \gamma_k \left(\Delta\text{BMI} \times \mathbb{1}\{t \geq \textit{June}\}\right) + \text{Ind.} \times \text{Time FE} + \text{Stock FE} + \text{Controls} + \varepsilon$$

- CAPM-implied **cost of equity** increases by **100 bps**

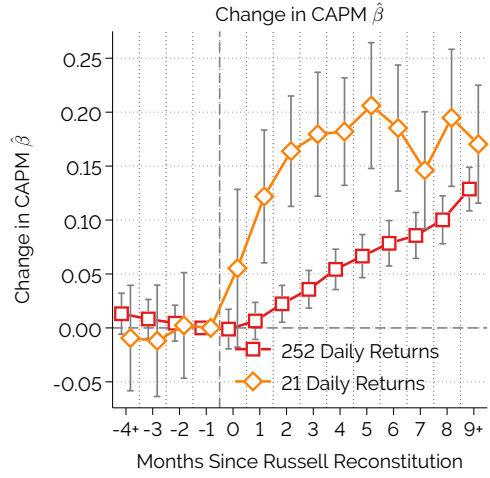

▸ Accuracy rank proxy ▸ Relevance ▸ Exclusion Restriction ▸ Price effect ▸ S&P 500 $\hat{\beta}$ ▸ Split by incr. and decr .in BMI

Exogenous increase in BMI leads to increase in CAPM $\hat{\beta}$

$$\text{CAPM } \hat{\beta}^{21d} = \sum_{k=-4}^{9} \gamma_k \left(\Delta \text{BMI} \times \mathbb{1}\{t \geq \textit{June}\}\right) + \text{Ind.} \times \text{Time FE} + \text{Stock FE} + \text{Controls} + \varepsilon$$

▸ Persist. shock ▸ Within-R^2 w/ FE ▸ Shapley ▸ Firm fundamentals ▸ Frequency/Price pressure ▸ Flow reg. ▸ Simulation

Effects of Benchmark-linked Ownership on Perceived Cost of Equity

Firm managers use CAPM to estimate cost of equity in practice

Surveys

- Graham & Harvey (2001): 74% of CFOs (almost) always use CAPM
- Jacobs & Shivdasan (2012): 90% use CAPM in DCF
- Mukhlynina & Nyborg (2016): 76% (almost) always use CAPM
- Graham (2022): 80% of CFOs (almost) always use CAPM

Revealed Preferences

- Krüger et al. (2015): managers use CAPM in capital budgeting
- Jaganathan et al. (2016): CAPM βs explain discount rates of CFOs
- Dessaint et al. (2020): managers use CAPM to value acquisitions
- Gormsen & Huber (2024): perc. cost of capital correlates with CAPM
- Cho & Salarkia (2025): managers use CAPM to time repurchases

Other Professions

- Berk & Binsbergen (2015); Barber et al. (2016): investors use CAPM
- Jensen (2023): stock analysts use CAPM
- Décaire & Graham (2025): 96.8% of stock analyst reports use CAPM
- Kontz (2025): utility regulators use CAPM

▸ User cost of capital elasticity ▸ Intangibles investment ▸ IOR doesn't explain CAPM $\hat{\beta}$

Investment falls by 7.8% in response to a 10 p.p. year-on-year BMI increase

$$\log\left(Inv_{i,t+h}\right) - \log\left(Inv_{i,t-1}\right) = \gamma^h(\text{BMI}_{i,t} - \text{BMI}_{i,t-1}) + \text{Ind.} \times \text{Year FE} + \text{Controls} + \varepsilon_{i,t+h}$$
$$= \theta^h(\text{IOR}_{i,t} - \text{IOR}_{i,t-1}) + \text{Ind.} \times \text{Year FE} + \text{Controls} + \epsilon_{i,t+h}$$

▸ User cost of capital elasticity ▸ Intangibles investment ▸ IOR doesn't explain CAPM $\hat{\beta}$

Is impulse response consistent with a cost of capital increase?

Testable implication of a discount-rate shock: stronger investment responses for

1. Firms with a **higher equity share** in WACC
   Greater exposure to equity discount-rate shocks
2. Firms with **longer duration** of investment goods
   Higher present-value sensitivity to changing WACC ($\partial PV/\partial WACC \approx 1/\delta$)

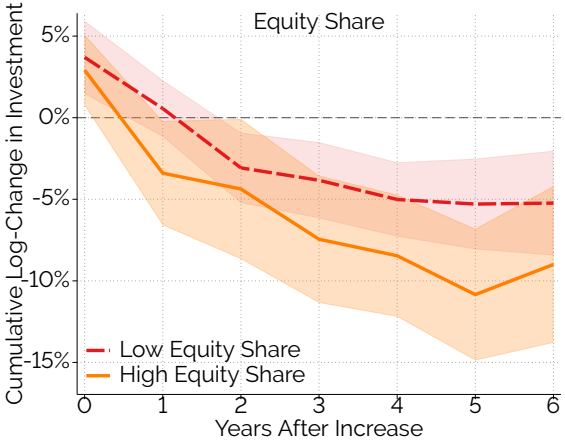

➟ stronger effects along these dimensions support a discount-rate channel

▸ User cost of capital elasticity

$$\log\left(Inv_{i,t+h}\right) - \log\left(Inv_{i,t-1}\right) = \gamma_1^h \left(\text{BMI}_{i,t} - \text{BMI}_{i,t-1}\right) + \gamma_2^h \, \mathbb{1}\{\text{High}\}_{i,t} \times \left(\text{BMI}_{i,t} - \text{BMI}_{i,t-1}\right) + \mathbb{1}\{\text{High}\}_{i,t} + \text{Ind.} \times \text{Year FE} + \text{Controls} + \varepsilon_{i,t+h}$$

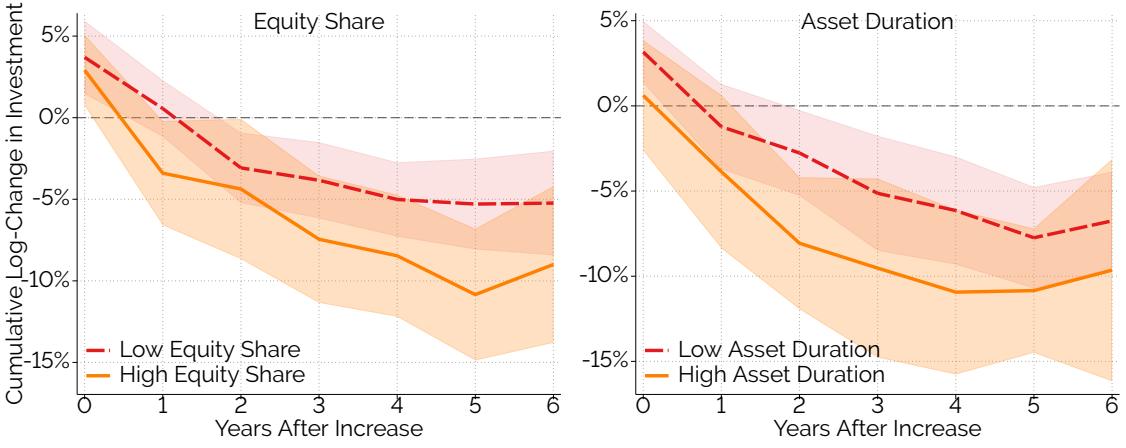

Effects are larger for firms with high equity share

$$\log\left(Inv_{i,t+h}\right) - \log\left(Inv_{i,t-1}\right) = \gamma_1^h \left(\text{BMI}_{i,t} - \text{BMI}_{i,t-1}\right) + \gamma_2^h \, \mathbb{1}\{\text{High}\}_{i,t} \times \left(\text{BMI}_{i,t} - \text{BMI}_{i,t-1}\right) + \mathbb{1}\{\text{High}\}_{i,t} + \text{Ind.} \times \text{Year FE} + \text{Controls} + \varepsilon_{i,t+h}$$

Effects are larger for firms with high equity share or high asset duration

$$\log\left(Inv_{i,t+h}\right) - \log\left(Inv_{i,t-1}\right) = \gamma_1^h \left(\text{BMI}_{i,t} - \text{BMI}_{i,t-1}\right) + \gamma_2^h \, \mathbb{1}\{\text{High}\}_{i,t} \times \left(\text{BMI}_{i,t} - \text{BMI}_{i,t-1}\right) + \mathbb{1}\{\text{High}\}_{i,t} + \text{Ind.} \times \text{Year FE} + \text{Controls} + \varepsilon_{i,t+h}$$

Natural Experiment 1: exog. variation in BMI from Russell Reconstitutions

$$\log\left(Inv_{i,t+h}\right) - \log\left(Inv_{i,t-1}\right) = \gamma^h \Delta \text{BMI}_{i,t} + \text{Ind.} \times \text{Year FE} + \text{Controls} + \varepsilon_{i,t+h}$$

Natural Experiment 1: exog. variation in BMI from Russell Reconstitutions

Why are managers reducing investment? Incentives matter...

- Many firms use **Capital Efficiency Targets** in executives compensation
- 41% of Russell 3000 use these targets in **long-term incentive plans** (Reda & Tonello, 2015)

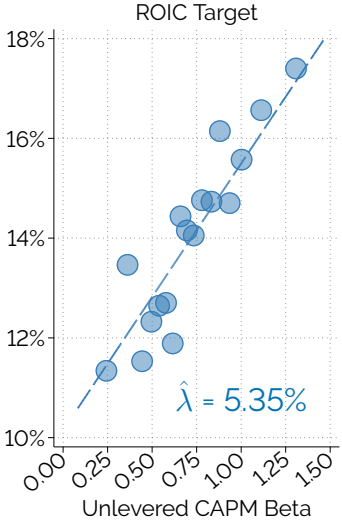

Why are managers reducing investment? Incentives matter...

- Many firms use **Capital Efficiency Targets** in executives compensation
- 41% of Russell 3000 use these targets in **long-term incentive plans** (Reda & Tonello, 2015)

Our executive compensation program emphasizes performance-based compensation and is designed to tie directly to the drivers of value creation for the Company's shareholders, as summarized below.

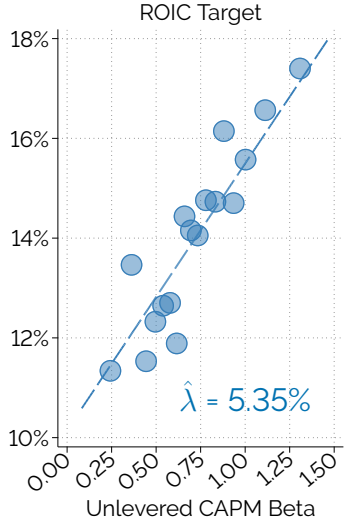

Key Elements		
Pay Element	**Form**	**Performance Metric**
Base Salary	Cash	> Base salary is set at market-competitive levels
Annual Cash Incentives	Cash	> 70% Absolute EPS(1) > 30% Strategic Goals
LTIP	50% - PSUs	> 60% three-year Relative EPS Growth(1) > 40% three-year Average Return on Invested Capital ("ROIC")(1) minus the Weighted Average Cost of Capital ("WACC")(1)
	50% - RSUs	> Stock price performance

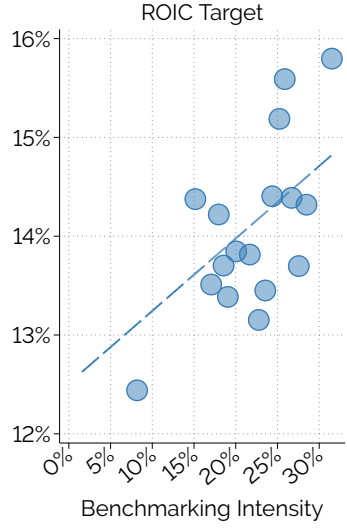

Source: Arrow Electronics' 2024 proxy statement (p. 44)

$$\text{ROIC Target} = \text{CAPM } \hat{\beta}^A + \text{Year FE} + \text{Firm FE} + \varepsilon$$

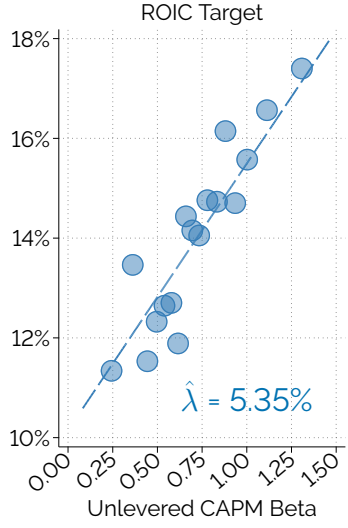

back | Details on ISS Incentive Lab data

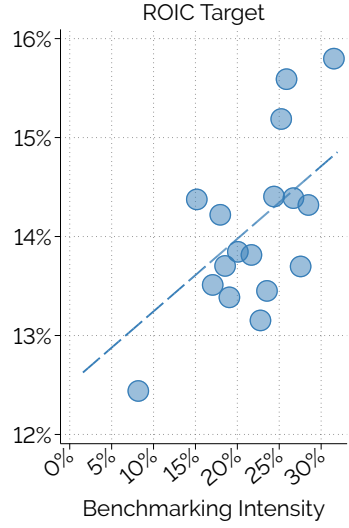

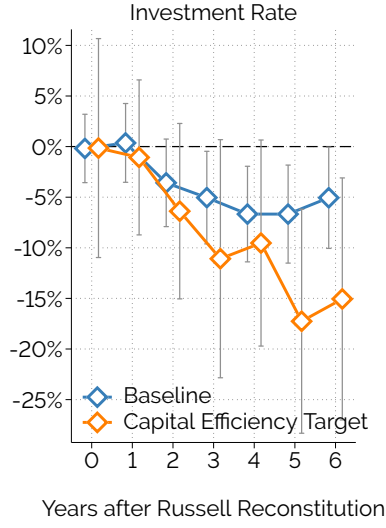

$$\text{ROIC Target} = \text{BMI} + \text{Year FE} + \text{Firm FE} + \varepsilon$$

Firm managers use CAPM to estimate cost of equity in practice

back to MBA

Surveys

- Graham & Harvey (2001): 74% of CFOs (almost) always use CAPM
- Jacobs & Shivdasan (2012): 90% use CAPM in DCF
- Mukhlynina & Nyborg (2016): 76% (almost) always use CAPM
- Graham (2022): 80% of CFOs (almost) always use CAPM

Revealed Preferences

- Krüger et al. (2015): managers use CAPM in capital budgeting
- Jaganathan et al. (2016): CAPM βs explain discount rates of CFOs
- Dessaint et al. (2020): managers use CAPM to value acquisitions
- Gormsen & Huber (2024): CAPM explains 50% of variation in perc. cost of capital
- Cho & Salarkia (2025): managers use CAPM to time repurchases

Other Professions

- Berk & Binsbergen (2015); Barber et al. (2016): mutual fund investors use CAPM
- Jensen (2023); Decaire & Graham (2024): stock analysts use CAPM
- Kontz (2025): utility regulators use CAPM

*"On the equity component, we calculate cost of equity using the **capital asset pricing model** using historical data and market risk premiums. Our current cost of equity is running around 9%."*

— CFO, Archer Daniels Midland (Q1 2012)

Executives Commenting on Russell Index Inclusion

◂ Quotes ◂ ICC

- Analyze all 163 earnings call transcripts that mention Russell index inclusion from 2008 to 2024

- Assign transcripts sequentially into one of four categories:
  1. **Equity Offerings:** Discussion of an at-the-market offering, seasoned equity offering, shelf takedown, or other equity raise
  2. **Liquidity:** Mention increased stock liquidity or trading volume
  3. **Visibility:** Mention increased visibility or a broader investor base
  4. **Passing Mention:** A brief note of inclusion, no further context

Modal comment:

"The first half of this year has been extremely productive, and we are driving continued progress, sustainable and profitable growth as a leader and the disruptor of the B2B e-commerce technology solution. ***We were honored to be added to the Russell 2000 Index through their recent reconstitution.*** *Now I will turn the call over to Iman to provide more color and – on our operational highlights."*

"Top line data from our PEDFIC-1 Phase III trial is expected at the end of 2019 or early 2020. ***And finally, we were selected for inclusion in the Russell 2000 Index Russell as part of the annual reconstitution of the Russell stock indexes.*** *And with that, let me turn the call back over to Ron for some concluding remarks."*

Managers reference CAPM when talking about cost of equity

back

*"If you use some of the tools I learned in my MBA class, like the **capital asset pricing model**, they did teach that back in the 80s by the way, so it's been around for a while. I think our cost of equity is around 10%"*

— CFO, Qorvo Inc. (Q4 2015)

*"This is our way of calculating the cost of equity. So this is very textbook like **CAPM** type of methodology. We start with the risk-free rate […]. Then we look at the group's beta."*

— CFO, Talanx (Q4 2019)

*"If you don't push your ROE target up when interest rates go up, and that's for every company to decide, it depends if you believe in the **capital asset pricing model** or not. I won't take you back to school. […] I think you should [expect a higher ROE]."*

— CFO, Intact Financial (Q3 2024)

*"So the investment is about $240 million. We expect to project finance the deal so we will be, I think, around $130 million equity investment. […] I'm not going to get in to what our cost of capital is but most people can probably — I mean everybody knows **CAPM** and can kind of back into what it is."*

— CEO, Vistra Energy (Q1 2017)

*"From a cost of capital perspective, we update our cost of capital estimates monthly. So yes, there are changes that go on a monthly basis looking at interest rates and looking at local country risk, as well as betas and all of the things that go into kind of the **CAPM** model."*

— CEO, American Tower Corp. (Q4 2013)

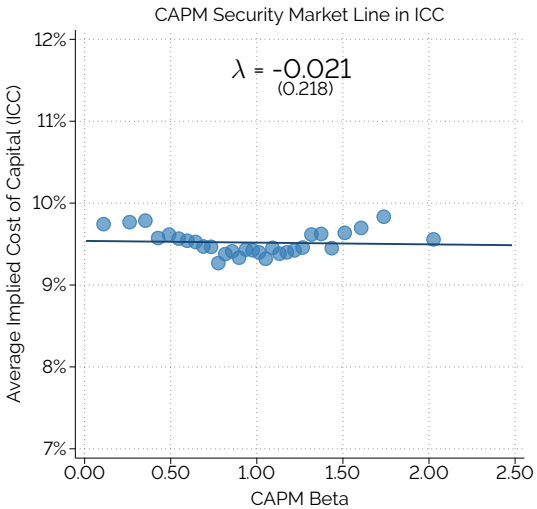

*"We haven't historically disclosed our cost of equity, but it's actually fairly straightforward calculation from a **CAPM** model, so in terms of where we're coming out. But I think from that, you're going to get around a 10%-ish type range cost."*

— CEO, E-Trade (Q1 2016)

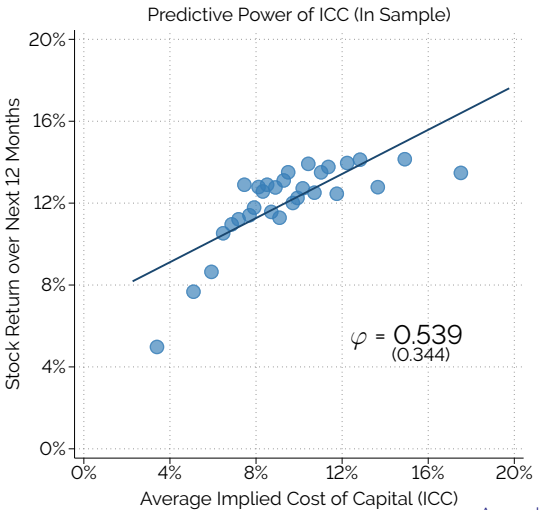

CAPM security market line is flat in implied cost of capital
